AB Provided are a method for preparing a hydroxyalkylalkylcellulose for a joint compound, a hydroxyalkylalkylcellulose for a joint compound prepared by the method which is used to improve flow resistance and to prevent sagging when applied to a joint compound, and a joint compound containing the hydroxyalkylalkylcellulose. The method comprises the steps of injecting an alkali metal hydroxide into cellulose in ratio of 0.5-4 mol. to cellulose, stirring the mixture, and injecting an alkylene oxide into the mixture in a ratio of 0.3-1.0 mol. to cellulose to perform first reaction; and injecting an alkali metal hydroxide into the obtained one in a ratio of 0.5-3 mol. to cellulose, dispersing it, and injecting an alkyl halide to it in a ratio of 1-2.5 mol. to the added alkali metal hydroxide to perform second reaction to prepare a hydroxyalkylalkylcellulose. Preferably the first reaction is carried out at 60-110°, and the second reaction is carried out at 50-120°.

AB Provided is a method for preparing a hydroxyalkyl cellulose ether whose dissoln. time can be controlled without addnl. additive in a single processing system. The method comprises the steps of reacting an alkali metal hydroxide, cellulose, ethylene oxide and a crosslinking agent in a ratio of 0.0001-0.1 mol. to cellulose in a reaction solvent for 1-2 h after increasing the temperature to 60-90° for 1-2 h so as to obtain a hydroxyalkyl cellulose ether; and neutralizing and filtering the obtained hydroxyalkyl cellulose ether, mixing 100 parts by weight of the hydroxyalkyl cellulose ether and 0.1-10 parts by weight of a surface treating agent to surface-treat the hydroxyalkyl cellulose ether, and drying and pulverizing it simultaneously.

AB Provided is a method for preparing hydroxyalkyl cellulose, which shows an improved reaction efficiency in the reaction materials, reduces introduction of the reaction materials into waste water, and increases the yield of hydroxyalkyl cellulose to 60% or higher. The method for preparing hydroxyalkyl cellulose via the reaction of cellulose with an etherifying agent comprises the steps of: introducing an alkali metal hydroxide to cellulose in a molar ratio of 0.5-4 mol per mol. of the cellulose, agitating the mixture, introducing an alkylene oxide thereto in a molar ratio of 0.5-3 mol per mol. of the cellulose, further introducing an alkyl halide thereto in an amount of 20-95 wt% of the total amount of the alkyl halide, and carrying out a reaction; and introducing an alkali metal hydroxide to the reaction mixture in an amount of 1-4 mol per mol. of the cellulose, dispersing the mixture, further introducing an alkyl halide thereto in an amount of 5-8- wt% of the total amount of the alkyl halide, and carrying out a reaction.

AB The present invention relates to a method for preparing hydroxyalkyl alkyl cellulose with high yield, by treating finely ground pulp with an alkali metal hydroxide at room temperature, reacting it with an alkylene oxide and an alkyl halide, and then adding an alkali metal hydroxide and an alkyl halide thereto. The method of the present invention is highly economical and also environment-friendly because waste of the reactants can be greatly reduced.

AB An additive composition is provided to enhance the performance of tile cement by the improvements in water retentivity, flowability and strength, and to raise the workability by the extension in work-time and the reduction in sag. The additive composition for tile cement comprises 80-99.9 weight% of cellulose ethers and 0.1-20 weight% of polysaccharides. In particular, the cellulose ethers are selected from Me cellulose in which a Me DS is 0.27-2.0, hydroxypropyl Me cellulose in which a Me DS is 0.27-2.50, and a hydroxypropyl MS is 0.02-1.1, hydroxyethyl Me cellulose in which a Me DS is 0.27-2.40 and a hydroxyethyl MS is 0.03-1.3, and hydroxyethyl cellulose in which a hydroxyethyl MS is 0.3-5.0. The polysaccharides are gum polysaccharides, non-gum polysaccharides and a mixture

AB Provided are a method for grinding and drying cellulose ether and derivs. thereof and a grinder and a dryer used therein, which shorten a conventional production process remarkably, save facility expenses and operation expenses, and improve grinding efficiency. The method for grinding and drying cellulose ether and derivs. thereof comprises the steps of: inducing air of 100-250°C heated by a temperature control unit to come into a gas line; supplying materials comprising moisture-containing cellulose ether to the gas line; introducing the materials and the air to a grinder through the gas line; and grinding and drying the cellulose ether in the grinder simultaneously.

PRIORITY APPLN. INFO.:

AB In particular, hydroxyalkyl cellulose derivs. are prepared by reacting cellulose and ethylene oxide in the presence of alkali metal hydroxide, where the reaction between cellulose and ethylene oxide is performed in the presence of iso-PrOH azeotropic solvent in a horizontally agitated reactor, where the ethylene oxide is supplied via 2 steps, thus resulting in a 2-step reaction, and the amount of alkali metal hydroxide remaining after the first reaction is controlled, enabling to provide hydroxyalkyl cellulose derivs. having improved enzymic resistance and turbidity and to remarkably decrease the solvent usage to have economical and environmental advantages.

AB Fine powdered cellulose ethers are prepared in a cost-effective manner having high running efficiency by subjecting pulverized cellulose to alkalization using alkalinizing agent, such as caustic soda, mixing the alkalinized cellulose with etherifying agent selected from alkyleneoxide and alkyl halide, heating the reaction mix. from 40 to 60° for 10-60 min, from 45-75° for 60-180 min, and from 80-90° for 60-180 min, and dilute gas, such as di-Me ether and di-Et ether, can be injected into the mix. system before the addition of the etherifying agent. Thus, cellulose alkalinized with caustic soda was reacted with ethylene oxide and Me halide in the presence of di-Me ether dilute gas to receive cellulose Et Me ether.
